

Database

Tomoyuki Konno

TRG/DAQ workshop

2017/08/25, NTU, Taipei

DAQ database

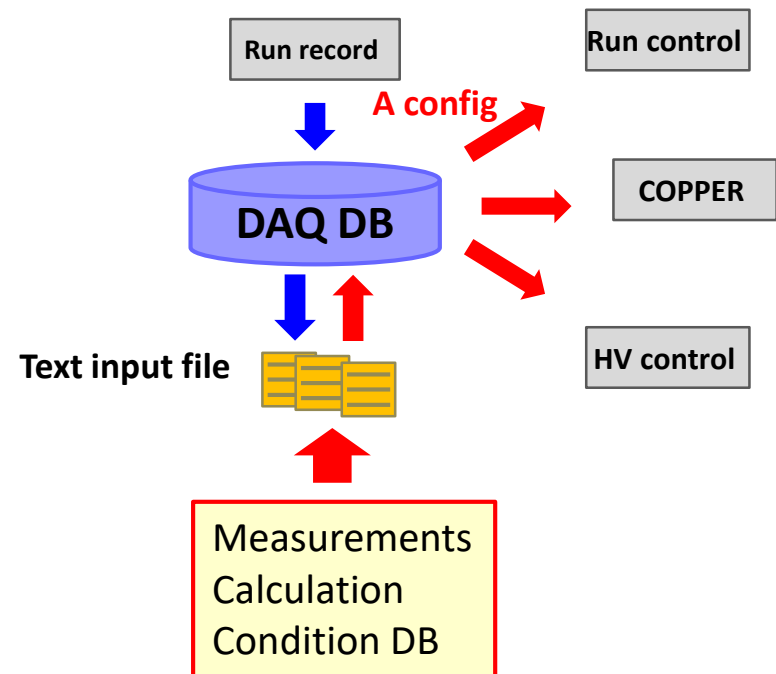

- Relational database server is used to store configuration and logs
 - PostgreSQL 9.3 on 10 TB RAID6 storage
 - Connected to daqnet and b2nsm/b2epics networks
- **Configuration DB** gives configuration parameters
 - Text parser to objects / DB parser to objects
 - An instruction for DAQ DB is available for Belle II collaborators:
<https://confluence.desy.de/display/BI/DAQ+database>
 - **Run record** is a kind of configuration DB table updated at run start/end
- **Logger DB** shows histories of detector status and DAQ activities
 - Text messages via NSM2 are stored into database
- Archiver for monitored values => covered by S. Park
 - Conversion of NSM2 into EPICS Archiver Appliance

Configuration DB

- Configuration DB is available using the command line tools below:
 - Text -> DB : **daqdbcreate** <filepath> <tablename>
 - DB -> text (stdout) : **daqdbget** <tablename> <configname>
- Running in global/local run control, HV control, some detector operations
 - Run record is also stored as same db table format

```
#  
  
config      : cdc:fee:cpr2075:a:suppress:045  
  
firm       : recbe_v52_170213.bit

    const DBObjectList o_reg30s(obj.getObjects("reg30"));
    for (size_t i = 0; i < o_reg30s.size(); i++) {
        const DBObject& o_reg30(o_reg30s[i]);
        unsigned int val = o_reg30.getInt("val");
        hslb.writefee8(0x30, val);
    }
}
```

Switching DAQ configuration

- DAQ configuration can be reloaded from DB by CONFIGURE
 - Run control has a nested scheme to replace configuration
 - `nsm://set:<RC>:config` in CSS
 - or
 - `$ rcrequest <RC> CONFIGURE` in command line
- CDC case:
 - `suppress:...` for usual run
 - `raw:...` for calibration

```
nodename      : CDC01
config        : RC:suppress:2017:06:14:02

node[0].name  : ROPC201
node[0].rcconfig : suppress Load latest config.
node[1].name  : CPR2001 with "RC:suppress:..."
node[1].rcconfig : suppress
node[2].name  : CPR2002
node[2].rcconfig : suppress
node[3].name  : CPR2003
node[3].rcconfig : suppress
...
```

```
nodename      : CDC01
config        : RC:raw:2017:06:14:02

node[0].name  : ROPC201
node[0].rcconfig : raw Load latest config.
node[1].name  : CPR2001 with "RC:raw:..."
node[1].rcconfig : raw
node[2].name  : CPR2002
node[2].rcconfig : raw
node[3].name  : CPR2003
node[3].rcconfig : raw
...
```

Run record

- Run record stores NSM vars at run start and end into database
 - Editable variable list
 - var : <nsm node>@<var name>
 - name : name in database
- Currently global run record are stored
 - Detector enabled / disabled
 - Run type (manually edited)
 - Run start time
 - Trigger count (in/out)
 - Statft (FTSW status summary)
- Easily extends to local run control
 - Detector run control can be added new run records

configuration of run record input

```
#
vars[0].var      : RUNCONTROL@cdc.used
vars[0].name     : RC.CDC.used.I
vars[1].var      : RUNCONTROL@top.used
vars[1].name     : RC.TOP.used.I

Previous 1 2 3 4 5 ... 20 Next

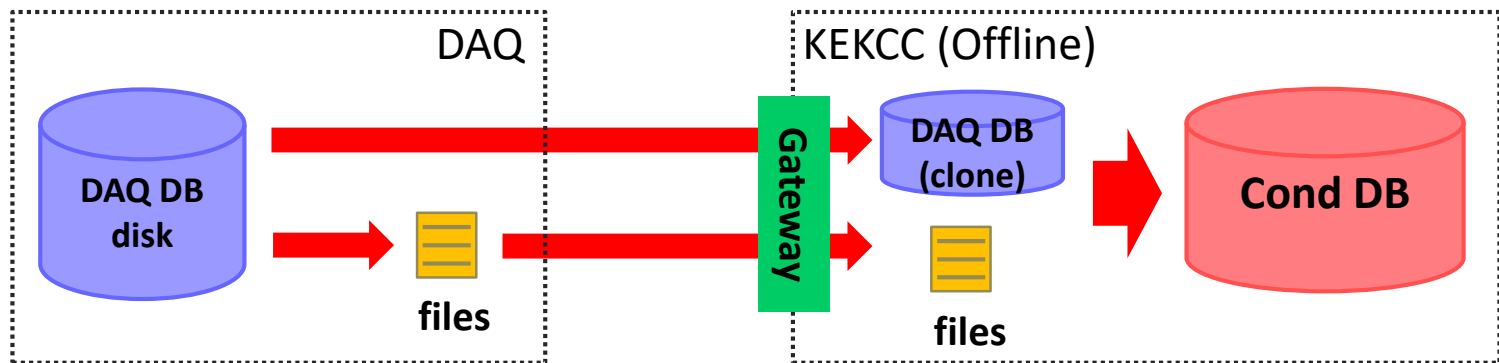

- Text logs are collected from slow control processes via NSM2
- Web interface with PHP + Bootstrap
 - Search using Node name, Priority, (Date), (Messages)
- Masking messages according to log level

DAQ Log level

- There are 6 log levels:
 - DEBUG : debugging info (not shown by default)
 - INFO : information showing system running well
 - NOTICE : also good information but need to confirm (e.g. run start)
 - WARNING : error message but run can continue
 - ERROR : error message to stop run
 - FATAL : critical error message to be sent to expert
- I'm now reducing # of messages to improve shifter's convenience
 - Too many event counters misses sometime important messages
 - HLT software should be more clear for reasons of trouble
- Some detector (TOP) starts sending log messages but a bit too many
 - Called FEE interface class (TOPFEE) in COPPER slow control
 - Maeda-san will tune threshold of warning messages

Porting DAQ DB to offline

- Replication of DAQ DB to Offline
 - DB contents are pulled from offline database
 - DAQ accepts postgresql (5432) port from KEKCC
 - Config DB is converted into Cond DB by database group
- Transport **dumped files** for monitoring
 - http (80) access to get files by wget or curl
 - KEKCC side downloads files periodically (one per day?)
- **A dedicated IP in KEK network is assigned to DAQ DB server**
 - Thanks to Yamagata-san
 - Transfer scheme is not established yet, need contribution from DB group

Summary

- Several functions in the DAQ database are implemented and running
 - Configuration DB provides configuration parameters
 - Run record is stored into database every run start/end
 - => variables are collected from NSM variables
 - Logger DB shows message histories about detector/DAQ status
- A little but important progress for porting DAQ DB to offline system
 - Now DAQ DB server is open to KEKCC
 - Database is commonly available for Belle II members
 - Need feedback from Database group

Archiving System

From S. Park
(Yonsei University)

- EPICS Archiver Appliance : https://slacmshankar.github.io/epicsarchiver_docs/
 - Archiver of EPICS records => NSM2-to-EPICS converter is introduced
 - Available from web and Control System Studio

EPICS Archiver Appliance for Belle II DAQ

Home Reports Metrics Storage Appliances Integration

Help

This is the archiver for Belle II DAQ. If you have any questions, please contact the Belle II DAQ group.

To check the status of or to archive some PV's, please type in some PV names here.

Check Status

The screenshot displays the EPICS Archiver Appliance interface. On the left, there is a search panel with a URL field set to 'pbraw://172.22.16.70:1761', a search box containing 'Dacrintis_Kav', and a list of PV names. The main area shows a graph with two traces: 'B2_nsm:get:KSPREADER:CDC' (green) and 'B2_nsm:get:KSPREADER:DCD' (orange). The graph shows two distinct pulses. Below the graph is a table with columns for 'Show', 'Item (PV, Form)', 'Display Name', 'Color', 'Cursor Timestamp', 'Cursc', 'Scan Peri', 'Buffer Si', 'Axis', 'Trace Typ', 'Widt', 'Point', 'Size', 'Request', and 'Inde'. The table contains two rows of data.

Show	Item (PV, Form)	Display Name	Color	Cursor Timestamp	Cursc	Scan Peri	Buffer Si	Axis	Trace Typ	Widt	Point	Size	Request	Inde
<input checked="" type="checkbox"/>	B2_nsm:get:KSP	B2_nsm:get:KSP	Green	2017-06-18 21:54:54.1	22 [2]	0.0	5000	Value 1	Area	2	None	2	Optimized	0
<input checked="" type="checkbox"/>	B2_nsm:get:KSP	B2_nsm:get:KSP	Orange	2017-06-18 21:54:54.1	23 [2]	0.0	5000	Value 1	Area	2	None	2	Optimized	0

Archiving System

From S. Park
(Yonsei University)

- File based recording scheme is adapted with data size reduction in time
- Json format for global use is possible

○ Features of the archiver [http access is available to copy records](#)

- Retrieving data type: txt, raw (pbraw://), json (web browser)
 - Developer says that csv, svg, mat(matlab) also available.

- Data is stored of text file on the below directory structure
 - “\$sts/B2_nsm/get/KSPREADER/CDC_TEMP_B01/####.pb”

- Three kinds of storage depends on the time

- ~ day
- Fast but small storage is efficient

- ~ week ~ month

- ~ month ~ year
- Large but slow storage is efficient
- Compression option
